WHIN® Safe Huber Needle
Instructions for Use

**Insertion:** After removing needle guard and stabilizing the port, insert primed needle through the skin into the port. Ensure the needle has reached the bottom of the port.

**Infusion:** Attach a fully primed syringe or administration set to the injection site or hub of the extension set. Aspirate to confirm patency. Flush before and after medication administration, per institutional protocol, to maintain patency.

**Removal:** Stabilize the port by placing two fingers on the WHIN Safe base. Withdraw the needle by pulling straight up on the wings. A click is heard when the safety shield is activated.

**Disposal:** Dispose as per your institution’s protocol. For clinical and technical support, call 800-854-6851. See product labeling for complete product information.
Secure the WHIN Safe Huber Needle to skin using sterile tape or Steri-Strip® closures placed vertically on both sides of the base plate.

Secure tubing to skin, allowing adequate slack in the tubing prior to applying tape. This will avoid excessive pressure or torquing of the WHIN Safe Huber Needle.

Cover the WHIN Safe Huber Needle with a semi-permeable transparent dressing, stretching the dressing if needed. Crimp or “tent” the dressing over the needle hub after application to promote secure adherence.

Maintain the dressing until scheduled change, the sterility is compromised and/or the WHIN Safe Huber Needle is removed.

For clinical and technical support, call 800-854-6851. See product labeling for complete product information.
